

Text Retrieval and Web Search

IIR 2: The term vocabulary and postings lists

Mihai Surdeanu

(Based on slides by Hinrich Schütze at informationretrieval.org)

Spring 2017

Overview

- 1 Tokenization
- 2 Normalization
- 3 Skip pointers
- 4 Phrase queries

Motivation

“In 2000, the Institute of Medicine reported that an estimated 98,000 preventable patient deaths occur annually in US hospitals due to . . .”

Take-away

- Understanding of the basic unit of classical information retrieval systems: what is a **token**?
- Tokenization: how to get from raw text to words (or tokens)
- More complex indexes: skip pointers and phrases

Outline

- 1 Tokenization
- 2 Normalization
- 3 Skip pointers
- 4 Phrase queries

Definitions

- **Document** – File, email, newspaper article, tweet, Facebook post, etc. A column in the term-document incidence matrix.
- **Token == Word** – A delimited string of characters as it appears in a document.
- **Term** – A “**normalized**” (case, morphology, spelling etc) and **unique** word. It is included in the index.
- **Type** – An equivalence class of tokens (e.g., “USA” and “U.S.A”). Not necessarily in the index.

Normalization

- Need to “normalize” words in indexed text as well as query terms into the same form.
- Example: We want to match *U.S.A.* and *USA*
- We most commonly implicitly define **equivalence classes** of terms, which are created during normalization.
- There are also **explicit** equivalence classes:
 - Soundex: IIR 3 (phonetic equivalence, Muller = Mueller)
 - Thesauri: IIR 9 (semantic equivalence, car = automobile)
- What's the best way to handle (explicit) equivalence classes?

Normalization: Other languages

- Normalization and language detection interact.
- *PETER WILL NICHT MIT.* → MIT = mit
- *He got his PhD from MIT.* → MIT \neq mit

Recall: Inverted index construction

- Input:

Friends, Romans, countrymen. So let it be with Caesar ...

- Output:

friend roman countryman so ...

- Each token is a candidate for a postings entry.
- What are valid tokens to emit?

Exercises

In June, the dog likes to chase the cat in the barn. – How many word tokens? How many terms?

Why tokenization is difficult – even in English. **Tokenize:** *Mr. O'Neill thinks that the boys' stories about Chile's capital aren't amusing.*

Tokenization problems: One word or two? (or several)

- Hewlett-Packard
- State-of-the-art
- co-education
- the hold-him-back-and-drag-him-away maneuver
- data base
- San Francisco
- Los Angeles-based company
- cheap San Francisco-Los Angeles fares
- York University vs. New York University
- What is a simple heuristic?

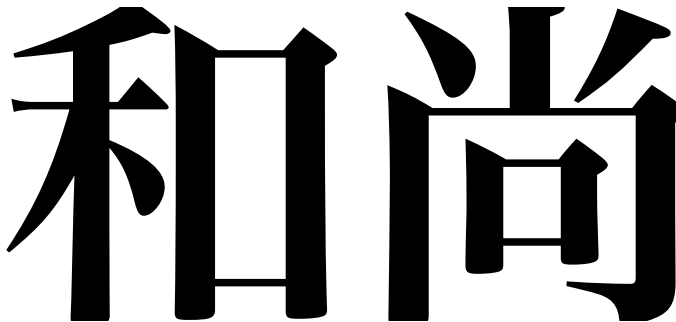

Numbers

- 3/20/91
- 20/3/91
- Mar 20, 1991
- 100.2.86.144
- (800) 234-2333
- 800.234.2333
- Older IR systems may not index numbers ...
- ... but generally it's a useful feature.
- Google example

Chinese: No whitespace

莎拉波娃现在居住在美国东南部的佛罗里达。今年4月9日，莎拉波娃在美国第一大城市纽约度过了18岁生日。生日派对上，莎拉波娃露出了甜美的微笑。

Ambiguous segmentation in Chinese

The image shows two large, bold Chinese characters, '和' (he) and '尚' (shang), written in a traditional serif font. They are positioned side-by-side, with a significant gap between them. The character '和' is on the left and '尚' is on the right. The characters are black on a white background.

The two characters can be treated as one word meaning 'monk' or as a sequence of two words meaning 'and' and 'still'.

Other cases of “no whitespace”

- Compounds in Dutch, German, Swedish
- Computerlinguistik → Computer + Linguistik
- Lebensversicherungsgesellschaftsangestellter (life insurance company employee)
- → leben + versicherung + gesellschaft + angestellter
- Inuit: tusaatsiarunnangittualuujunga (I can't hear very well.)
- Many other languages with segmentation difficulties: Finnish, Urdu, ...
- Have you read “The Awful German Language” by Mark Twain?

Japanese

ノーベル平和賞を受賞したワンガリ・マータイさんが名誉会長を務めるMOTTA I N A Iキャンペーンの一環として、毎日新聞社とマガジンハウスは「私の、もったいない」を募集します。皆様が日ごろ「もったいない」と感じて実践していることや、それにまつわるエピソードを800字以内の文章にまとめ、簡単な写真、イラスト、図などを添えて10月20日までにお送りください。大賞受賞者には、50万円相当の旅行券とエコ製品2点の副賞が贈られます。

4 different “alphabets”: Chinese characters, hiragana syllabary for inflectional endings and function words, katakana syllabary for transcription of foreign words and other uses, and latin. No spaces (as in Chinese).

Arabic script: Bidirectionality

استقلت الجزائر في سنة 1962 بعد 132 عاما من الاحتلال الفرنسي.

← → ← →

← START

‘Algeria achieved its independence in 1962 after 132 years of French occupation.’

It's hard and boring!

- This is a big pain for any IR/NLP software. Let's look at Stanford's CoreNLP.
- It's best if you don't do this at home but instead use existing software:
 - NLTK in Python: <http://www.nltk.org/book/ch03.html>
 - CoreNLP in Java:
<http://stanfordnlp.github.io/CoreNLP/simple.html>

Outline

- 1 Tokenization
- 2 Normalization
- 3 Skip pointers
- 4 Phrase queries

Accents and diacritics

- Accents: résumé vs. resume (simple omission of accent)
- Umlauts: Universität vs. Universitaet (substitution with special letter sequence “ae”)
- Most important criterion: How are users likely to write their queries for these words?
- Even in languages that standardly have accents, users often do not type them. (Polish, Romanian)

Case folding

- Reduce all letters to lower case
- Even though case can be semantically meaningful
 - capitalized words in mid-sentence
 - MIT vs. mit
 - Fed vs. fed
 - ...
- It's often best to lowercase everything. Why?

Stop words

- stop words = extremely common words which would appear to be of little value in helping select documents matching a user need
- Examples: *a, an, and, are, as, at, be, by, for, from, has, he, in, is, it, its, of, on, that, the, to, was, were, will, with*
- Stop word elimination used to be standard in older IR systems.
- But you need stop words for phrase queries, e.g. “King of Denmark”
- Most web search engines index stop words.

Lemmatization

- Reduce inflectional/variant forms to base form
- Example: *am, are, is* → *be*
- Example: *car, cars, car's, cars'* → *car*
- Example: *the boy's cars are different colors* → *the boy car be different color*
- Lemmatization implies doing “proper” reduction to dictionary headword form (the **lemma**).
- Inflectional morphology (*cutting* → *cut*) vs. derivational morphology (*destruction* → *destroy*)
- Use WordNet for proper lemmatization. For a quick hack...

Stemming

- Definition of stemming: Crude heuristic process that **chops off the ends of words** in the hope of achieving what “principled” lemmatization attempts to do with a lot of linguistic knowledge.
- Language dependent
- Often inflectional **and** derivational
 - Example for derivational: *automate*, *automatic*, *automation* all reduce to *automat*
 - Example for inflectional: *am*, *are*, *is* reduce to *be*

Porter algorithm

- Most common algorithm for stemming English
- Results suggest that it is at least as good as other stemming options
- Conventions + 5 phases of reductions
- Phases are applied sequentially
- Each phase consists of a set of commands.
 - Sample command: Delete final *ement* if what remains is longer than 1 character
 - replacement → replac
 - cement → cement
- Sample convention: Of the rules in a compound command, select the one that applies to the longest suffix.

Porter stemmer: A few rules

Rule

SSES → SS

IES → I

SS → SS

S →

Example

caresses → caress

ponies → poni

caress → caress

cats → cat

Three stemmers: A comparison

Sample text: Such an analysis can reveal features that are not easily visible from the variations in the individual genes and can lead to a picture of expression that is more biologically transparent and accessible to interpretation

Porter stemmer: such an analysi can reveal featur that ar not easili visibl from the variat in the individu gene and can lead to a pictur of express that is more biolog transpar and access to interpret

Lovins stemmer: such an analys can reve featur that ar not eas vis from th vari in th individu gen and can lead to a pictur of expres that is mor biolog transpar and acces to interpre

Paice stemmer: such an analys can rev feat that are not easy vis from the vary in the individ gen and can lead to a pict of express that is mor biolog transp and access to interpret

WordNet Lemmatization

- Based on morphological analysis + dictionary lookup rather than “chopping” suffixes
- What are the advantages/disadvantages?
- Demo: <http://textanalysisonline.com/nltk-wordnet-lemmatizer>
- Code:
 - Python: http://www.nltk.org/_modules/nltk/stem/wordnet.html
 - Java: <http://stanfordnlp.github.io/CoreNLP/simple.html>

Does stemming improve effectiveness?

- In general, stemming increases effectiveness for some queries, and decreases effectiveness for others.
- Queries where stemming is likely to help: [tartan sweaters], [sightseeing tour san francisco]
- (equivalence classes: {sweater,sweaters}, {tour,tours})
- Porter Stemmer equivalence class *oper* contains all of *operate operating operates operation operative operatives operational*.
- Queries where stemming hurts: [operational AND research], [operating AND system], [operative AND dentistry]

Exercise: What does Google do?

- Stop words (??)
- Normalization
- Tokenization
- Lowercasing
- Stemming Do they use WordNet?
- Non-latin alphabets
- Umlauts
- Compounds
- Numbers

Outline

- 1 Tokenization
- 2 Normalization
- 3 Skip pointers**
- 4 Phrase queries

Recall basic intersection algorithm

BRUTUS \longrightarrow $\boxed{1} \rightarrow \boxed{2} \rightarrow \boxed{4} \rightarrow \boxed{11} \rightarrow \boxed{31} \rightarrow \boxed{45} \rightarrow \boxed{173} \rightarrow \boxed{174}$

CALPURNIA \longrightarrow $\boxed{2} \rightarrow \boxed{31} \rightarrow \boxed{54} \rightarrow \boxed{101}$

Intersection \implies $\boxed{2} \rightarrow \boxed{31}$

- Linear in the length of the postings lists.

Recall basic intersection algorithm

BRUTUS \longrightarrow $\boxed{1} \rightarrow \boxed{2} \rightarrow \boxed{4} \rightarrow \boxed{11} \rightarrow \boxed{31} \rightarrow \boxed{45} \rightarrow \boxed{173} \rightarrow \boxed{174}$

CALPURNIA \longrightarrow $\boxed{2} \rightarrow \boxed{31} \rightarrow \boxed{54} \rightarrow \boxed{101}$

Intersection \implies $\boxed{2} \rightarrow \boxed{31}$

- Linear in the length of the postings lists.
- Can we do better?

Skip pointers

- Skip pointers allow us to **skip** postings that will not figure in the search results.
- This makes intersecting postings lists more efficient.
- Some postings lists contain several million entries – so efficiency can be an issue even if basic intersection is linear.
- Where do we put skip pointers?
- How do we make sure intersection results are correct?

Skip lists: Example

Intersecting with skip pointers

INTERSECTWITHSKIPS(p_1, p_2)

```
1  answer  $\leftarrow \langle \rangle$ 
2  while  $p_1 \neq \text{NIL}$  and  $p_2 \neq \text{NIL}$ 
3  do if  $\text{docID}(p_1) = \text{docID}(p_2)$ 
4      then  $\text{ADD}(\text{answer}, \text{docID}(p_1))$ 
5           $p_1 \leftarrow \text{next}(p_1)$ 
6           $p_2 \leftarrow \text{next}(p_2)$ 
7  else if  $\text{docID}(p_1) < \text{docID}(p_2)$ 
8      then if  $\text{hasSkip}(p_1)$  and  $(\text{docID}(\text{skip}(p_1)) \leq \text{docID}(p_2))$ 
9          then while  $\text{hasSkip}(p_1)$  and  $(\text{docID}(\text{skip}(p_1)) \leq \text{docID}(p_2))$ 
10             do  $p_1 \leftarrow \text{skip}(p_1)$ 
11             else  $p_1 \leftarrow \text{next}(p_1)$ 
12      else if  $\text{hasSkip}(p_2)$  and  $(\text{docID}(\text{skip}(p_2)) \leq \text{docID}(p_1))$ 
13          then while  $\text{hasSkip}(p_2)$  and  $(\text{docID}(\text{skip}(p_2)) \leq \text{docID}(p_1))$ 
14             do  $p_2 \leftarrow \text{skip}(p_2)$ 
15             else  $p_2 \leftarrow \text{next}(p_2)$ 
16  return answer
```

Exercise

Where do we place skips?

- Tradeoff: number of items skipped vs. frequency skip can be taken
- More skips: Each skip pointer skips only a few items, but we can frequently use it.
- Fewer skips: Each skip pointer skips many items, but we can not use it very often.

Where do we place skips? (cont)

- Simple heuristic: for postings list of length P , use \sqrt{P} evenly-spaced skip pointers.
- This ignores the distribution of query terms.
- Easy if the index is static; harder in a dynamic environment because of updates.
- How much do skip pointers help?
- They used to help a lot.
- With today's fast CPUs and in-memory indices, they don't help that much anymore.

Outline

- 1 Tokenization
- 2 Normalization
- 3 Skip pointers
- 4 **Phrase queries**

Phrase queries

- We want to answer a query such as [stanford university] – as a phrase.
- Thus *The inventor Stanford Ovshinsky never went to university* should **not** be a match.
- The concept of phrase query has proven easily understood by users.
- About 10% of web queries are phrase queries.
- Consequence for inverted index: it no longer suffices to store docIDs in postings lists.
- Two ways of extending the inverted index:
 - biword index
 - positional index

Biword indexes

- Index every consecutive pair of terms in the text as a phrase.
- For example, *Friends, Romans, Countrymen* would generate two biwords: “*friends romans*” and “*romans countrymen*”
- Each of these biwords is now a vocabulary term.
- Two-word phrases can now easily be answered.

Longer phrase queries

- A long phrase like “*stanford university palo alto*” can be represented as the Boolean query “STANFORD UNIVERSITY” AND “UNIVERSITY PALO” AND “PALO ALTO”
- We need to do post-filtering of hits to identify subset that actually contains the 4-word phrase!

Issues with biword indexes

- Why are biword indexes rarely used?

Issues with biword indexes

- Why are biword indexes rarely used?
- False positives, as noted above
- Index blowup due to very large term vocabulary

Positional indexes

- Positional indexes are a more efficient alternative to biword indexes.
- Postings lists in a **nonpositional** index: each posting is just a docID
- Postings lists in a **positional** index: each posting is a docID and **a list of positions**

Positional indexes: Example

Query: *"to₁ be₂ or₃ not₄ to₅ be₆"*

Positional indexes: Example

Query: *"to₁ be₂ or₃ not₄ to₅ be₆"*

TO, 993427:

- ⟨ 1: ⟨7, 18, 33, 72, 86, 231⟩;
- 2: ⟨1, 17, 74, 222, 255⟩;
- 4: ⟨8, 16, 190, 429, 433⟩;

Document 4 is a match!

Proximity search

- We just saw how to use a positional index for phrase searches.
- We can also use it for proximity search.
- For example: employment /4 place
- Find all documents that contain EMPLOYMENT and PLACE within 4 words of each other.
- *Employment agencies that place healthcare workers are seeing growth* is a hit.
- *Employment agencies that have learned to adapt now place healthcare workers* is not a hit.

Proximity search

- Use the positional index
- Simplest algorithm: look at cross-product of positions of (i) `EMPLOYMENT` in document and (ii) `PLACE` in document
- Very inefficient for frequent words, especially stop words
- Note that we want to return the actual matching positions, not just a list of documents.
- This is important for dynamic summaries etc.

“Proximity” intersection

```

POSITIONALINTERSECT( $p_1, p_2, k$ )
1   $answer \leftarrow \langle \rangle$ 
2  while  $p_1 \neq \text{NIL}$  and  $p_2 \neq \text{NIL}$ 
3  do if  $\text{docID}(p_1) = \text{docID}(p_2)$ 
4      then  $I \leftarrow \langle \rangle$ 
5           $pp_1 \leftarrow \text{positions}(p_1)$ 
6           $pp_2 \leftarrow \text{positions}(p_2)$ 
7          while  $pp_1 \neq \text{NIL}$ 
8          do while  $pp_2 \neq \text{NIL}$ 
9              do if  $|\text{pos}(pp_1) - \text{pos}(pp_2)| \leq k$ 
10                 then  $\text{ADD}(I, \text{pos}(pp_2))$ 
11                 else if  $\text{pos}(pp_2) > \text{pos}(pp_1)$ 
12                     then break
13                  $pp_2 \leftarrow \text{next}(pp_2)$ 
14                 while  $I \neq \langle \rangle$  and  $|I[0] - \text{pos}(pp_1)| > k$ 
15                     do  $\text{DELETE}(I[0])$ 
16                     for each  $ps \in I$ 
17                         do  $\text{ADD}(answer, \langle \text{docID}(p_1), \text{pos}(pp_1), ps \rangle)$ 
18                      $pp_1 \leftarrow \text{next}(pp_1)$ 
19                  $p_1 \leftarrow \text{next}(p_1)$ 
20                  $p_2 \leftarrow \text{next}(p_2)$ 
21             else if  $\text{docID}(p_1) < \text{docID}(p_2)$ 
22                 then  $p_1 \leftarrow \text{next}(p_1)$ 
23             else  $p_2 \leftarrow \text{next}(p_2)$ 
24 return  $answer$ 

```

Exercise!

Combination scheme

- Biword indexes and positional indexes can be profitably combined.
- Many biwords are extremely frequent: Michael Jackson, Britney Spears etc
- For these biwords, increased speed compared to positional postings intersection is substantial.
- Combination scheme: Include frequent biwords as vocabulary terms in the index. Do all other phrases by positional intersection.

Take-away

- Understanding of the basic unit of classical information retrieval systems: what is a **token**?
- Tokenization: how to get from raw text to words (or tokens)
- More complex indexes: skip pointers and phrases
